**Problem 1**

 **Excel Work**

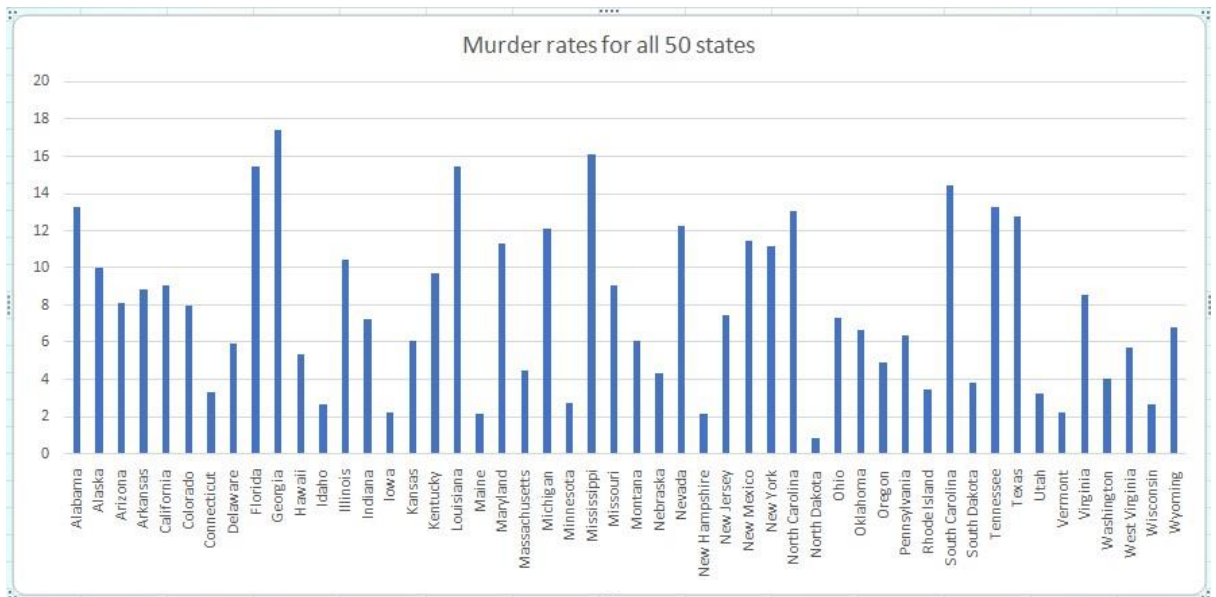

- † Prepare the dataset to establish a relation between an urban population category and a crime type.**

State	Murder	Assault	UrbanPop	Urban_pop_cat	crime_type
Alabama	13.2	236	58	medium	Very High
Alaska	10	263	48	small	Very High
Arizona	8.1	294	80	Extra large	Very High
Arkansas	8.8	190	50	medium	High
California	9	276	91	Extra large	Very High
Colorado	7.9	204	78	Extra large	Very High
Connecticut	3.3	110	77	Extra large	less
Delaware	5.9	238	72	Extra large	Very High
Florida	15.4	335	80	Extra large	Very High
Georgia	17.4	169.94	60	large	Very High
Hawaii	5.3	46	83	Extra large	less
Idaho	2.6	120	54	medium	less
Illinois	10.4	249	83	Extra large	Very High
Indiana	7.2	113	65	large	less
Iowa	2.2	56	57	medium	least
Kansas	6	115	66	large	less
Kentucky	9.7	109	52	medium	less
Louisiana	15.4	249	66	large	Very High
Maine	2.1	83	51	medium	least
Maryland	11.3	300	67	large	Very High
Massachusetts	4.4	149	85	Extra large	less
Michigan	12.1	255	74	Extra large	Very High
Minnesota	2.7	72	66	large	least
Mississippi	16.1	259	44	small	Very High
Missouri	9	178	70	Extra large	High
Montana	6	109	53	medium	less
Nebraska	4.3	102	62	large	less
Nevada	12.2	252	81	Extra large	Very High
New Hampshire	2.1	57	56	medium	least
New Jersey	7.4	159	89	Extra large	High
New Mexico	11.4	285	70	Extra large	Very High
New York	11.1	254	86	Extra large	Very High
North Carolina	13	337	45	small	Very High
North Dakota	0.8	45	44	small	least
Ohio	7.3	120	75	Extra large	less
Oklahoma	6.6	151	68	large	High
Oregon	4.9	159	67	large	High
Pennsylvania	6.3	106	72	Extra large	less
Rhode Island	3.4	174	87	Extra large	High
South Carolina	14.4	279	48	small	Very High
South Dakota	3.8	86	45	small	least
Tennessee	13.2	188	59	medium	High
Texas	12.7	201	80	Extra large	Very High
Utah	3.2	120	80	Extra large	less
Vermont	2.2	48	32	small	least
Virginia	8.5	156	63	large	High
Washington	4	145	73	Extra large	less
West Virginia	5.7	81	39	small	less
Wisconsin	2.6	53	66	large	least
Wyoming	6.8	161	60	large	High

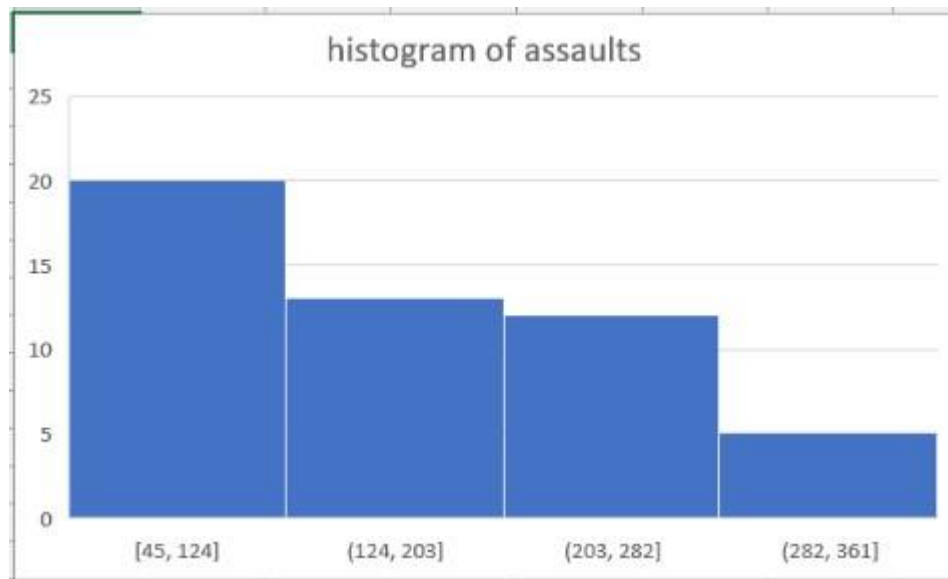

✚ Plot Murder rate vs. Assault rate.

✚ Plot Murder rates for all 50 states.

✚ Plot histogram of assaults.

## MySQL Work

### Data Discovery

In this part, we discover the variable types and their summary statistics in the data. First, we upload the USArrests dataset.

The screenshot shows the MySQL Workbench interface. At the top, a query editor window titled "Query 1" contains the SQL statement: `select * from usarrests;`. Below the query editor, the "Result Grid" tab is active, displaying a table with the following data:

State	Murder	Assault	UrbanPop
Alabama	13.2	236	58
Alaska	10	263	48
Arizona	8.1	294	80
Arkansas	8.8	190	50
California	9	276	91
Colorado	7.9	204	78
Connecticut	3.3	110	77
Delaware	5.9	238	72
Florida	15.4	335	80
Georgia	17.4	0	60
Hawaii	5.3	46	83
Idaho	2.6	120	54
Illinois	10.4	249	83

Below the Result Grid, the "Output" tab is active, showing the execution details of the query. The output table has the following data:

#	Time	Action	Message	Duration / Fetch
1	10:17:20	select * from usarrests LIMIT 0, 1000	50 row(s) returned	0.000 sec / 0.000 sec

## ✚ Detect Missing values

The image shows a SQL query editor and its results in a database management tool. The top panel, titled "Query 1", contains two SQL statements:

```
1 • select * from usarrests;  
2 • select avg(assault) from usarrests;
```

The middle panel displays the "Result Grid" for the second query. It shows a single column labeled "avg(assault)" with a single row containing the value "166.5400".

The bottom panel shows the "Action Output" for the same query. It displays a table with columns: #, Time, Action, Message, and Duration / Fetch. The output shows that the query was executed successfully, returning 1 row(s) in 0.000 sec / 0.000 sec.

The bottom panel also shows the SQL query editor with the following statements:

```
1 • select * from usarrests;  
2 • select avg(assault) from usarrests;  
3 • set sql_safe_updates=0;  
4 • update usarrests set assault=166.5400 where state='Georgia';  
5
```

State	Murder	Assault	UrbanPop
Alabama	13.2	236	58
Alaska	10	263	48
Arizona	8.1	294	80
Arkansas	8.8	190	50
California	9	276	91
Colorado	7.9	204	78
Connecticut	3.3	110	77
Delaware	5.9	238	72
Florida	15.4	335	80
Georgia	17.4	167	60
Hawaii	5.3	46	83
Idaho	2.6	120	54
Illinois	10.4	240	83

#	Time	Action	Message	Duration / Fetch
1	10:18:54	select avg(assault) from usarrests LIMIT 0, 1000	1 row(s) returned	0.000 sec / 0.000 sec
2	10:19:48	select * from usarrests LIMIT 0, 1000	50 row(s) returned	0.000 sec / 0.000 sec
3	10:20:03	set sql_safe_updates=0	Error Code: 1193. Unknown system variable 'sql_safe_update'	0.000 sec
4	10:20:06	set sql_safe_updates=0	0 row(s) affected	0.000 sec
5	10:20:08	update usarrests set assault=166.5400 where state='Georgia'	1 row(s) affected Rows matched: 1 Changed: 1 Warnings: 0	0.000 sec
6	10:20:10	select * from usarrests LIMIT 0, 1000	50 row(s) returned	0.000 sec / 0.000 sec

✚ Find min, max, mean, and variance of all numeric attributes in SQL

Query 1

Limit to 1000 rows

3

•

set sql\_safe\_updates=0;

4

•

update usarrests set assault=166.5400 where state='Georgia';

5

•

select min(murder), max(murder),avg(murder), variance(murder),

6

## Conclusion:

To conclude, in this article, we examine the explanatory data analysis and which visualization types we can use for the explanatory data analysis. As stated above it is a very crucial step and it must be done before future engineering and model building to better understand data. This data set contains statistics, in arrests per 100,000 residents for assault, murder, and rape in each of the 50 US states in 1973. Also given is the percent of the population living in urban areas. This is a systematic approach for identifying and analyzing patterns and trends in crime using USArrest dataset.

† Display the sorted infant mortality rates in descending order.

The screenshot displays a SQL IDE interface with a query editor and a results pane. The query editor contains 14 lines of SQL code. The results pane shows the output of the query, which is a list of infant mortality rates sorted in descending order.

**Query 1**

```
8 • select max(infant_mortality_rate),min(infant_mortality_rate) from child_mortality;
9 • select year from child_mortality where infant_mortality_rate=64.8; -- max
10 • select Year from child_mortality where infant_mortality_rate=30.5; -- min
11 • select avg(under_five_mortality_rate),avg(infant_mortality_rate),avg(neonatal_mortality_rate) from child_mortality;
12 • select Year from child_mortality where neonatal_mortality_rate>=27.49; -- avg(neonatal_mortality_rate)
13 -- Display the sorted infant mortality rates in descending order.
14 • select infant_mortality_rate from child_mortality order by infant_mortality_rate desc;
```

## Conclusion

Childhood is a significant stage of life and deprivation during this period can have a long-term adverse impact on the wellbeing of children. Reduction in infant and child mortality is likely the most important of the millennium development goals, as children are the most important assets of a nation. The focus of this paper is to examine the determinants of childhood mortality and child health in India and the factors explaining the differential performance of the child immunization and treatment of childhood diseases. For this purpose data are taken from the three rounds of the National Family Health Survey of India (NFHS) conducted in 1992-93, 1998-99 and 2005-06.
